

What are metal chips?

Metal Chips including Iron,Steel,and Aluminum Chips are actual machined chips,which are sized using USA test sieves and not manufactured from metal powders. Primary use of these materials is aerospace fuel system testing,hydraulic system components testing,automatic transmission system testing,and power steering pump testing.

What are metal chip distributions made of?

All metal chip distributions are available in gram quantities with a minimum order of 20 grams. Stainless Steel Chips are made from 304 Stainless Steel. Custom distributions are available upon request. Particle size analysis is not included with these materials.

Can hedging improve steel price transparency?

As steel markets grow in maturity and look towards the use of derivatives and hedging tools,it is probably a good time to consider how hedging can increase the transparency of steel pricingand reducing the risks of volatile price trends.

What type of steel is used for heading dies?

Dies and Inserts - W1 and W2 tool steelscan be used for simple heading dies made without inserts. Inserts are normally made from high-alloyed steels,such as D2,M2,and M4 (60 HRC to 64 HRC),or from tungsten carbide having a relatively high percentage of cobalt (13 % to 25 %) for higher toughness.
