

What is star grounding?

To avoid this, star grounding is a way to isolate the ground for your audio equipment. Here's the basic idea: Star grounding creates a dedicated, isolated path for the ground of your audio gear, keeping it separate from other systems like lighting or HVAC. This minimizes electrical noise and interference in your recordings.

How do I connect my audio equipment to a ground bus?

o Step 1: Install isolated ground outlets for all your audio equipment. These outlets help keep the ground for your audio gear separate. o Step 2: Run a separate ground wire from these outlets to a dedicated ground bus. This bus can either be in the panel or a separate location.

What is a ground bus?

This central hub (called the ground bus) is isolated from other systems in the house until it all ties back to the main electrical panel. Here's how you can do it: 1. Use Isolated Ground Outlets: For your studio gear, use special outlets called isolated ground receptacles.

What is a ground loop?

This is called a ground loop. By connecting everything back to the main panel, you make sure that all grounds in your house are at the same electrical potential --meaning, there's no voltage difference between them that could cause hums, interference, or worse, safety issues.
