Should data centers use rack-level cooling?

Existing cooling systems in data centers mostly adopt room air conditioners, which can easily cause local hot spot issues with low energy efficiency. By contrast, the rack-level cooling technology, which adopts on-demand direct cooling, is regarded as a promising solution.

What is a self-cooling rack?

Self-cooling racks provide closed-loop precision cooling to help prevent mission-critical equipment in the rack from overheating. They are ideal for micro data centers or single-rack installations, particularly at the edge of a network. The warranty on this product has expired. If you need assistance, please contact us. What height should a data center rack be?

Common heights for floor-standing racks and rack enclosures are 42U, 45U and 48U, with custom sizes up to 58U available for some high-density data center applications. You may also wish to leave extra space for horizontal cable managers, future expansion or other purposes, so keep that in mind when determining the height.

Why do data centers need a reliable cooling system?

Since the cooling system needs to run 365 &#215; 24 h all year round, data centers have higher requirements for heat dissipation. A reliable cooling system is essential to ensure the thermal environment. The reliable operation of cooling systems not only depends on effective control but also on failure issue solutions.
